In this experiment I try to use Powerpoint and Looking Glass software to teach Optics in highschoools. In this way the photos from nature and images from LG software can gather and we can plan the lessons by students more attractive . the students are interested in this method ,because the usage of these softwares are easy to learn . specially ,when the optics lab come to help us for learning optics. I have had so many information by getting help to teach Physics with MM from internet . Now ,after 3 years to know these methods and use them, I can say the students have abilities to learn optics from electronic instrouments.
